

Software Architecture

the “fundamental organization of a system embodied in its components, their relations to each other, and the environment”

Previous Solutions

Architecture Description Languages (ADLs)

- (-) *Description*: Inferred by the name, ADLs only describe software architectures; they do not prescribe, or enforce conformance to them
- (+) *Analysis*: ADLs are focused on system analyses
- (+) *Formal Notation*: Currently, ADLs are the most formal mainstream architecture tools available

ArchJava

- Java extension unifying architecture and implementation
- (+) *Conformance*: Checks for architecture conformity
- (-) *Distributed Systems*: No conformance checks in distributed systems (ArchJava supports multiple systems via custom connectors, but does not enforce conformity)
- (-) *Multiple Views*: Lacks support for multiple architecture views; focuses only on Component-and-Connector view

Trinity's Approach

- Make software architecture a "live" component of Trinity systems
- Trinity enforced **architecture conformance** complements ADL analyses
- Support architecture conformance and **communication integrity** in **distributed systems**
- Directly translate the conceptual entities from multiple views into **code-enforced constructs**
- Support **all three software architecture views** (module or code, CnC, and deployment)

Design

Implementation Concepts

Trinity Architecture Components

- component**: a runtime entity that may interact with other components through ports.
- connector**: interaction pathways that join two compatible component ports.
- port**: component access points that can allow interaction with other components.
- attachments**: declarations that enable connections between compatible components to be made
- entryPoints**: a program starting point that permit execution.

Architecture concepts are translated into runtime entities in Trinity

Demonstrated Principles

Trinity's design demonstrates the following principles:

- Readability**
System architecture is contained in a single file and is prescriptive, uniting design and implementation.
- Reuse and Adaptability**
Compatibility checking and code generation make switching, adding, and removing architecture elements easier and more secure.
- Communication Integrity in Distributed Systems**

```
component Client
  port getInfo: requires CSIface

component Server
  port sendInfo: provides CSIface

external component DB
  port dbIface: target DBModule

connector JDBCctr
  val connectionString: String

architecture
  components
    RequestHandler ch
    DB db

  connectors
    JDBCctr jdbcCtr

  attachments
    connect rh.dbIface and db.dbIface
    with jdbcCtr

bindings
  sendInfo is rh.sendInfo
```

<INSERT EXAMPLE TRINITY CODE OF EXAMPLE ARCH.>
* describe each component

<INSERT SOFTWARE ARCHITECTURE DIAGRAM OF EXAMPLE>

```
architecture
  components
    Client client
    Server server

  connectors
    JSONctr jsonCtr

  attachments
    Connect client.getInfo and
    server.sendInfo with jsonCtr

  entryPoints
    Client: start
```

Example
